The components must be weighed accurately and mixed thoroughly to obtain optimal properties. The sides and bottom of mixing vessels must be included in the mixing process. Large mix quantities will show considerable exotherm, leading to short pot lives. Preferably mix smaller quantities or divide large mixes into smaller containers.

	at 176	14 - 17
	at 212	4 - 6
	at 248	2 - 3

The values shown are for small amounts of pure resin/hardener mix. In practice, fiber content and laminate thickness may modify the gel time to a very significant extent. In composite structures the gel time can differ significantly from the given values depending on the fiber content and the laminate thickness.

<b>TYPICAL CURE CYCLES</b>	
	1 day 23 °C + 15 h 50 °C or 1 day 23 °C + 4 h 100 °C

The optimum cure cycle has to be determined case by case, depending on the processing and the economic requirements.
