

GLOSSARY OF PLASTIC TOOLING TERMS

Adhesion – The state in which two surfaces are held together by interfacial force.

Coefficient of Thermal Expansion – The fractional change in length of a material for a unit of change in temperature. Normally expressed in in./in./°F.

Compressive Strength – A material's ability to withstand being crushed or squeezed under load. Often expressed in lb./in.², the compressive strength is the maximum amount of compressive stress a material can handle before permanently deforming.

Cure – To change the physical properties of a plastic or resin by chemical reaction, which may be condensation, polymerization, or addition: usually accomplished by the action of either heat or catalyst or both, and with or without pressure.

Deflection Temperature – The temperature at which a material will deform under a given load.

Density – Mass per unit volume of a substance, expressed in units such as grams per cubic centimeter, pounds per cubic foot, or pounds per gallon.
Density = Mass / Volume

Elasticity – A material's ability to return to its original shape after deformed by applied force or stress.

Endothermic – A chemical reaction which absorbs heat.

Exothermic – A chemical reaction which generates heat.

Flexural Modulus – A representation of the stiffness of a given material. Expressed as a ratio of stress to strain in bending, the flexural modulus measures how much a material is capable of bending prior to breaking.

Flexural Strength – Also known as "bend strength", this is a measure of a material's ability to resist bending under stress.

Glass Transition Temperature (T_g) – A reversible change that occurs when plastic is heated to a certain temperature range, characterized by a rather sudden transition from a hard, glassy, or brittle condition to a flexible or elastomeric condition.

Gel Time – With reference to thermosetting resins, the interval of time between the mixing of a two-component system and when the material ceases to flow. The system will exhibit a semi-solid/gel-like quality at this point.

Percentage of Elongation – Increase in length of a specimen at the instant before rupture occurs. Normally expressed as %.

Plasticity – A material's ability to undergo permanent and irreversible deformation under stress without breaking. The opposite of elasticity.

Post-curing – A secondary curing process in which a material is subjected to elevated heat after initial cure in mold at room temperature in order to further enhance its properties.

Pot-life (working life) – The period during which a compound, after mixing with a catalyst, solvent or other compounding ingredients, remains suitable for its intended use.

Shore Hardness (Indentation Hardness) – The hardness of a material as determined by either the size of an indentation made by an indenting tool under a fixed load, or the load necessary to produce penetration of the indenter to a pre-determined depth. Softer materials/more flexible materials are measured using the Shore A scale, and harder/more rigid materials are measured using the Shore D scale.

Taber Wear Index – The ability of a material to withstand mechanical action such as rubbing, scraping or erosion, that tends to progressively remove material from its surface. Usually expressed in milligrams loss per number of cycles per a given load.

Tensile Modulus – A representation of the stiffness of a given material. Expressed as a ratio of stress to strain under tensile/compressive stress, the tensile modulus measures how much a material is capable of being pulled prior to breaking.

Tensile Strength – A material's ability to resist being stretched or pulled before breaking.

Thermoforming – The process of forming a thermoplastic sheet into a three-dimensional shape by clamping the sheet in a frame, heating it to render it soft and flowable, then applying differential pressure to make the sheet conform to the shape of a mold or die positioned below the frame.

Thermoplastics – Resins or plastic compounds which in their final state as finished articles are capable of being repeatedly softened by increased temperature and hardened by decrease of temperature by means of physical change.

Thermosetting Plastics (thermosets) – Resins or plastic compounds which in their final state as finished articles are substantially infusible or insoluble. Thermosetting resins are often liquids at some stage in their manufacture or processing, which are cured by heat, catalyst or other chemical means. After being fully cured, thermosets cannot be reliquified by heat.

Thixotropy – The property of becoming less viscous when subjected to applied stress, such as stirring or shaking.

Viscosity – The thickness of a substance and its resistance to flow. The higher the viscosity number, the thicker the substance.

METRIC & ENGLISH CONVERSIONS

Liquid Volume

When you know	You can find	If you multiply by
ounces	milliliters	30
pints	liters	0.47
quarts	liters	0.946
gallons	liters	3.785
milliliters	ounces	0.034
liters	pints	2.1

PREPARING PATTERNS AND MOLDS

Sealing A Wood Pattern/Model

(also applies to plaster and sheet wax)

1. Apply one coat of Freeman Wood and Plaster Sealer (a fairly thin viscosity, lacquer-based paint) to the bare wood surface using a pure bristle brush and allow the material to absorb into the wood.

2. After the first coat has dried (about half an hour), you'll notice that the sealer has swelled the grain and made it rough. Using sand paper or Scotch-Brite®, lightly sand the surface to make it smooth again. Sanding is not necessary when working with plaster or sheet wax.

3. Wipe off the pattern with a cloth and then apply a second coat of sealer.

4. After allowing the second coat to dry, lightly sand the wood again and wipe it off with a cloth.

5. You are now ready to apply the release agents.

Applying Release Agents

1. Cover the entire surface with Freeman Wax Release (a semi-paste, typically applied with a brush).

2. Immediately buff coat lightly to remove excess.

3. We suggest at least two coats of Wax Release following the above process to make sure your entire part is covered evenly.

4. Next, you'll need to apply two layers of Partall PVA mold release (a polyvinyl alcohol) with brush or a spray.

5. Each coat will require a half hour of drying time unless you use a fan or air hose.

6. After the second coat of PVA has dried thoroughly, apply a final coat of Freeman Wax Release.

7. Buff this last coat very gently so as not to break through the layers of the PVA.

Additional Notes

- Epoxy, urethane, or metal patterns require only the use of wax release agents. Apply three coats and lightly buff after each.
- Plaster patterns should be dried in an air-circulating oven at 120°-125° F for 16 hours, or in dry air for 48 hours before applying sealer.
- Plaster patterns can also be sealed.
- Sheet Wax should be sealed with the aerosol version of the Wood and Plaster Sealer.

CALCULATING MATERIAL REQUIREMENTS

Step 1: Calculate Volume

Calculate the volume of the part (or mold) in cubic inches. Follow whichever shape is closest to your model or mold:

Volume of a Rectangle
 $L \times W \times H$

Volume of a Cylinder
 $3.14 \times R^2 \times H$

Step 2: Find Volumetric Yield

Find the volumetric yield for your material. This number, which can be found in most specification tables, represents how much coverage your material will achieve. If the Volumetric Yield is not available, you can calculate it based on the specific gravity (density).

How to Calculate Volumetric Yield if needed

1. Find the specific gravity (or density) on the specification table and/or SDS. This is measured in grams per cubic centimeter (grams/cm³).
2. Divide 27.68 by the density (grams/cm³) to calculate the Volumetric Yield (in.³/lb.).

Step 3: Determine Material Required

Divide the volume of the part in cubic inches (step 2) by the volumetric yield (step 1) to determine the amount of material required in pounds

$$\frac{\text{Volume of Model or Mold (in.³)}}{\text{Volumetric Yield (in.³/lb.)}} = \frac{\text{Weight of Product}}{\text{Required (lb.)}}$$

Step 4: Select Product

Select package size and quantity based on calculated weight.

CALCULATING MATERIAL FOR MIX RATIO

Once you know how much material you need in grams (lbs. x 453.6) and the product's mix ratio (found on the TDS or product packaging), you can calculate the material needed for each A & B (resin/hardener) components. Let's use an example.

A product's mix ratio is 100:60 by weight and you need 1,438 grams total.

Calculate total parts of resin and hardener combined.

Calculate total parts: 100 parts Resin to 60 parts Hardener = 160 parts total.

Calculate total grams need per part.

Divide total grams by total parts; 1,438 grams / 160 parts = 8.9875 grams/parts

Calculate grams need for each component of resin & hardener.

100 Parts Resin

$$100 \times 8.9875 = 898.75 \text{ Grams}$$

60 Parts Hardener

$$60 \times 8.9875 = 539.25 \text{ Grams}$$

You will need 898.75 Grams of Resin and 539.25 Grams of Hardener.

Terms & Conditions

Returned Goods

To save transportation charges, and facilitate handling of merchandise upon our receipt, we request that no merchandise be returned without prior written authorization.

Damaged Goods

Merchandise given to a transportation firm is their responsibility to deliver in satisfactory condition. If merchandise is delivered damaged, the customer should note as such on freight bill and file a claim with the delivering carrier. Regulations require that hidden damage, identified upon unpacking, must be reported within ten (10) days of delivery in order to file a proper claim.

Liability/Warranty Statement

Our products are intended for sale to industrial and commercial customers. We request that customers inspect and test our products before use and satisfy themselves as to contents and suitability. Nothing herein shall constitute a warranty, expressed or implied, including any warranty or merchantability or fitness, nor is protection from any law of patent to be inferred. All patent rights are reserved. The exclusive remedy for all proven claims is replacement of our materials and in no event shall we be liable for special, incidental, or consequential damages.
