Recommendations from our Tech Team

Q: What can I use to quickly and easily create a high volume of reproduced parts at a reasonable price point?

A: Our [Repro Fast-Cast Urethanes](#) can offer the perfect solution without breaking the bank. Our Repro line offers a wide variety products to fit an even wider variety of applications. You will also find replacements for previously discontinued items like Master Cast 721 M and Pro-Cast 3-33. You can always contact our Tech Team to discuss your specific application and we can recommend the appropriate Repro formulation.

Q: What can I use to tint your polyurethane resins?

A: [Freeman Color Tints](#) are perfect for tinting polyurethane and epoxy resin systems. For urethanes, mix thoroughly into the part B or Polyol side before combining with part A. For epoxies, add the tint to the resin side before combining with the hardener. At a rate of 0.01% to 3%, Freeman Color Tints can produce deep colors. You can also tint clear urethanes and epoxies to obtain a transparent color.

Q: What can I use to thin your epoxy resins?

A: There are no recommended thinning agents for use with epoxies. To obtain a lower viscosity, try heating the material to approximately 80°F for 1-2 hours. However, it's important to remember that when epoxy is warmed, the gel time of the material usually decreases, giving you less time to work. Perform a small-scale test prior to starting a project to gauge the effect of heat on your particular epoxy product.
